

Answer Key — Diseases: Causes and Types

Final answer with a one-line reason. Full methods are in the Notes' worked examples.

Objective

- Q1 **(b) Diabetes and asthma** — diabetes and asthma are lifestyle diseases that do not spread.
-
- Q2 **(b) pathogens** — germs that cause disease are pathogens.
-
- Q3 **(c) a mosquito (vector)** — mosquitoes are the vector that spreads the malaria protozoan.
-
- Q4 **(b) deficiency diseases (non-communicable)** — deficiency diseases come from missing nutrients and don't spread.
-
- Q5 **(a) True** — chickenpox is caused by a virus and spreads from person to person.
-
- Q6 **vectors** — such carrier insects are vectors.
-
- Q7 **chronic** — long-lasting diseases are chronic.
-

Short answer

- Q8 Communicable: caused by pathogens and spread person to person (e.g. typhoid). Non-communicable: caused by lifestyle/diet/deficiency and do not spread (e.g. diabetes).
-
- Q9 Through air (cough/sneeze), contaminated water/food, direct or indirect contact, and vectors (insects).
-
- Q10 Disease-causing organisms; e.g. bacteria, viruses, fungi, protozoa, worms (any three).
-

Long / application

- Q11 They have risen because of lifestyle changes — more processed/fatty/sugary food, less physical activity, obesity and longer lifespans. Prevention: balanced diet, regular exercise, avoiding tobacco/alcohol, limiting oil and sugar (any two).
-
- Q12 **Hepatitis A and cholera** (and typhoid) spread through contaminated water/food. TB and chickenpox spread through air, not water, so they would not spread this way.
-
