

Practice — Cells and Batteries

Section A is interactive — tap an option or type and press Check. Sections B and C are written practice.

Objective (1 mark each)**Q1 • MCQ****[1]**

A cell produces electric current because of —

- (a) a magnetic field (b) chemical reactions inside it (c) heating of a wire (d) sunlight

Q2 • MCQ**[1]**

In a Voltaic cell, the conducting liquid is called the —

- (a) electrode (b) electrolyte (c) element (d) terminal

Q3 • MCQ**[1]**

In a dry cell, the zinc container acts as the —

- (a) positive terminal (b) negative terminal (c) electrolyte (d) carbon rod

Q4 • MCQ**[1]**

In Fig 4.12, the LED glows in the cell using —

- (a) pure water (b) lemon juice (c) air (d) dry sand

Q5 • TRUE / FALSE**[1]**

A dry cell can be recharged and used again.

- (a) True (b) False

Q6 • FILL IN THE BLANK**[1]**

The two metal rods dipped in the electrolyte of a cell are called _____.

Q7 · FILL IN THE BLANK

[1]

The most common rechargeable battery today is the _____-ion battery.

Short answer (2 marks each)

Q8

[2]

Name the parts of a Voltaic cell and state what produces the electricity.

Q9

[2]

Why is a dry cell called "dry"? Name its positive and negative terminals.

Q10

[2]

Give two advantages of rechargeable batteries over dry cells.

Long / application (3 marks each)

Q11

[3]

Explain how you could build a simple cell using lemons, copper wire and iron nails to light an LED. Identify the electrodes and the electrolyte.

Q12

[3]

What does it mean for a cell to be "dead"? Why are rechargeable batteries increasingly preferred, and why should old batteries be disposed of carefully?
